AutoLISP has been used by thousands of Autodesk customers to automate their AutoCAD applications and customize their programs. The ObjectARX API is AutoCAD's cross-platform class library and contains a host of functions for improving object-oriented programming. By combining these classes and using AutoLISP or VBScript, one can perform an extensive array of programming tasks. AutoLISP AutoLISP is a custom scripting language based on LISP, and was designed for the application AutoCAD. Using the add-on.lsp technology, AutoLISP allows users to extend AutoCAD applications or add special features. A macro is a series of commands stored in a separate.lsp file. An AutoLISP application is made up of a series of macros called scripts. By combining commands from multiple macros, it is possible to achieve complex tasks. Some of the more common AutoLISP macros are described below: macro min: min(a,b,c) a b and a > c macro num: num(x) x macro date: date(x) x macro formula: formula(x,y) (x-y)/(x+y) macro s/t/r/c signs and text orientation macro l/c lines and circles macro p/s paths and splines macro a1d647c40b

Positron emission tomography (PET) is a well established imaging modality for studying the pathophysiology of neurodegenerative disease. Over the last two decades, a number of ligands for PET imaging of amyloid plaques in Alzheimer's disease (AD) have been developed. The best characterized is the radiotracer [11C]PIB, which is associated with a high signal-to-noise ratio, good specificity and good resolution in the majority of patients. However, the availability of [11C]PIB is limited, which may have adverse effects on the general use of this PET ligand for the evaluation of patients with AD. Several additional ligands have been developed
