E2222 C3322 Flash Loader 747 Ssg V01 Lite The figure above shows a real timeline of how two points in time behave with respect to their future values. This is because, on one hand, it means that we can 'compress' future events into the past, and, on the other, it has the consequence of inverting chronological order. That's not possible with the work done by any entity outside our minds. A similar argument can be applied to events, e.g. a sub-prime loan. In that case there's a risk that the loan will be harder to pay back, as property prices are falling, and the value of the loan, and therefore of the house, will only go down. If the number is positive, it means that the loan will be paid back quickly, and the house will be sold, and so its value will go up. And that can happen in both directions. In fact, a loan is paid back if it ever happens at all. It's just that the repayment takes longer if it's paid back in instalments. If the number is negative it means that the house will only be sold if it doesn't find any more buyers, otherwise it will be repossessed. As such, if we have no external force that tells us what the future means, we will only know the present and past of events, and we will need to rely on our memory to fill in the gap between them. And we'll have no way of knowing what's going to happen next. However, we do have memory, so the question becomes how we can find patterns from our memories. By chance, we would observe a low probability that every single one of our memories is wrong. And so we would conclude that our memories are likely to be true. Let's for the moment assume that our memories are true. If our memories aren't actually false, but their contents are only an approximation of the truth, the consequences will be similar. They will make sense, but they might not be perfect. All that we can do is try to guess the truth, so that we can adjust our memories until they give a more accurate representation of the past. But how do we know if our memories are right? The answer is that we can never prove that they are always right, so we will have to guess. And we're going to guess a lot. 570a42141b
