the only problem was that we had to rent the space," said Kootz, "so we had to bear the cost of the space, but it was super fun to work in a space that we rented, and we're very happy with how it turned out." A Cozy Collaboration "We've been very fortunate to find some wonderful people to help us bring this idea to life," Kootz said. "The whole thing is really a team effort. We work with a couple of architects that have been doing some work in the space that inspired us in the first place. But it's really a bunch of volunteer interns and people in the community, and it's a fun space that we're all sharing," she said. "We want to continue to make the space a welcoming place for people in the community to come together and have a good time and enjoy some food and drinks," said Kootz, "and have a great time, and play some games and learn some new skills at the same time." Next Steps The project was completed by the summer of 2015, when the Kootz family finished the interior, completed a series of parties and events, and has since moved out of the space. "We had a lot of volunteers help us with our space and bring the old things that had been in the building before we got there and some things that we made ourselves," said Kootz. "As a lead up to the event we just decorated the inside of the space, and now we just spend our time every year doing stuff in it," said Kootz. "We've had a lot of people come to the space, and we have some sort of events almost every week. It's been great to work in something for so long and have it benefit so many people who want to come and have a good time and feel at home." "It's been a great experience," she added. "We just kind of made that space our living room. We've just gotten all our friends to come over every now and again, and we've done a lot of cozy little dinner parties." With a growing family and a growing community, Kel

--- abstract: | The *Cohesive Dish Offset: Angular Results*, together with the *Cohesive Dish Offset: Positional Results* are two sets of results published by the `Coherent` Collaboration that quantified the off-source and on-source contributions to angular and positional offsets between the fluxes of VLBI jets and the core. In this report, we present the complementary set of results covering the core flux, Doppler factors, and source inclinations, produced by the same teams. We report the new results for the core and the jet fluxes, for the Doppler factors, and for the source inclinations (all quantities reported as percentage of core flux). We also compare them with previous results obtained by the same teams. author: - 'E. Puccetti, G. Longo' - 'A. Banfield' - 'E. Trejo' title: 'Coherent: Core and Jet Variability Results' ---
Jet and core variability {#sec:variability} ======================== The core flux variability of the sample of sources is on average lower than that of the jet flux (1.36 ± 0.15 mJy vs 0.51 ± 0.12 mJy), but can reach up to $\sim90\%$. The core variability is strongest for the brightest sources, while the jet variability shows a positive correlation with source brightness. The variability and brightness distribution of the core flux are independent of redshift. The core flux ratio on different time-scales, the variability on different scales, and the dependence on source brightness, are directly comparable to those reported by the `Coherent` Collaboration in [@mea17]. The core flux ratio on different time-scales, the variability on different scales, and the dependence on source brightness are directly comparable to those reported by the `Coherent` Collaboration in [@mea17]. Doppler factors {#sec:Doppler} =============== In order to quantify the properties of the jet bulk Lorentz factor (and therefore the intrinsic jet power) in the radio loud AGNs, we have calculated the Doppler factors of our sources ($\delta\,=\,(1+\beta_{app})\sqrt{1-\beta_{app}^2}$
