As adolescents are among the fastest growing subgroups of obese patients, it is important to understand the impact of bariatric surgery in this subgroup. Our study compared the impact of laparoscopic versus open bariatric surgery in adolescents. This is a prospective cohort study of consecutive adolescent patients undergoing laparoscopic adjustable gastric banding or laparoscopic Roux-en-Y gastric bypass between May 2004 and March 2006. The main outcome measure was the change in BMI after surgery, measured at 3-month intervals. Quality of life was assessed using the SF-36 questionnaire before and 1 year after surgery. Eighty-six adolescents (49 males; median age 16 years [range 12-18 years]) were included. Thirty-five patients underwent laparoscopic Roux-en-Y gastric bypass, and 51 underwent laparoscopic adjustable gastric
