

References Category:Pris1. Field of the Invention The present invention relates to a structure of a parking lamp lighting circuit which drives an auxiliary lamp for parking a vehicle to project beams for detecting a forward area of the vehicle by front beams and rear beams projected from parking lamps and also, by turn-on of light, can light up the auxiliary lamp for parking in a state where a vehicle is parked. The present invention also relates to a parking lamp lighting circuit and control method thereof for a vehicle equipped with this parking lamp lighting circuit. 2. Description of the Related Art A conventional vehicle has a structure that a parking lamp is provided on a front surface of a vehicle body. The parking lamp generates beams for detection of a forward area by front beams and rear beams projected from the parking lamp, and lights up the auxiliary lamp for parking (a rear lamp on the front side of a vehicle is also referred to as a parking lamp) when the parking lamp is turned on. For example, Japanese Unexamined Patent Application Publication No. 2011-226497 describes a control method of the parking lamp and the auxiliary lamp in a case where the auxiliary lamp for parking is lit in a state where a vehicle is parked with the parking lamp turned on. The conventional structure of the parking lamp lighting circuit is one that the parking lamp is controlled by a main switch for switching the parking lamp on/off. When a switch for setting the auxiliary lamp for parking is turned on by a driver, power is supplied to the auxiliary lamp for parking, and lighting up the auxiliary lamp for parking is performed. However, since the parking lamp is turned on/off by the main switch, a lighting-on operation and a lighting-off operation are repeated by the main switch when the driver opens and closes a door of a vehicle, and when the driver starts and stops the vehicle. Also, when a driver opens or closes a door of a vehicle, the auxiliary lamp for parking is not lit up. Therefore, this presents a problem in that the auxiliary lamp for parking is not clearly distinguished in front of the vehicle when the parking lamp is turned on. Also, since the main switch is turned on/off by a driver, there is a problem in that energy is wasted when the vehicle is not used for a certain length of time.[How many healthcare workers? The dilemma of continuing education]. The Division of Professional Services at the Medical Faculty of Mannheim has an outstanding service for continuing medical education (CME).
