Field of the Invention The present invention relates to an organic light emitting display (OLED) device, and more particularly, to an OLED device that can reduce the number of layers of an organic light emitting display panel. 2. Description of the Related Art An organic light emitting display (OLED) device displays an image using organic light emitting diodes (OLEDs), which are self-light emitting diodes that emit light through recombination of electrons and

holes. The OLED device does not need a backlight assembly that is used in a liquid crystal display device, which contributes to low power consumption, thin thickness, wide viewing angle, fast response speed, and the like. Furthermore, the OLED device can realize multi colors, and can be easily manufactured in a large scale at a low cost. Accordingly, the OLED device is highlighted as a next generation display device for the next generation. FIG. 1 is a cross-sectional view illustrating a structure of an OLED device according to a related art. Referring to FIG. 1, the related art OLED device includes a light emitting display panel 10 and a printed circuit board (PCB) 20 that are separately manufactured. The OLED device includes the light emitting display panel 10 and the PCB 20, and are electrically connected to each other by a tape 30. An upper substrate 12, a lower substrate 14, and the tape 30 are located on the light emitting display panel 10. The
